

HOME TASKS-III

Task 1:

Given a table containing information about bank deposits and withdrawals made using Paypal, write a query to retrieve the final account balance for each account, taking into account all the transactions recorded in the table with the assumption that there are no missing transactions.

transactions Table:

Column Name	Type
transaction_id	integer
account_id	integer
amount	decimal
transaction_type	varchar

transactions Example Input:

transaction_id	account_id	amount	transaction_type
123	101	10.00	Deposit
124	101	20.00	Deposit
125	101	5.00	Withdrawal
126	201	20.00	Deposit
128	201	10.00	Withdrawal

Using account ID 101 as an example, \$30.00 was deposited into this account, while \$5.00 was withdrawn. Therefore, the final account balance can be calculated as the difference between the total deposits and withdrawals which is \$30.00 - \$5.00, resulting in a final balance of \$25.00.

Solution: SELECT

account_id,

SUM(
CASE

WHEN transaction_type = 'Deposit' THEN amount

WHEN transaction_type = 'Withdrawal' THEN -amount

END

) AS final_balance

FROM transactions

GROUP BY account_id;

Output

account_id	final_balance
301	62.00
101	25.00
201	26.00

Expected

account_id	final_balance
301	62.00
101	25.00
201	26.00

Sourced from [PayPal](#) Difficulty **Easy**

Input PostgreSQL 14

```
1 SELECT
2   account_id,
3   SUM(
4     CASE
5       WHEN transaction_type = 'Deposit' THEN amount
6       WHEN transaction_type = 'Withdrawal' THEN -amount
7     END
8   ) AS final_balance
9 FROM transactions
10 GROUP BY account_id;
```

Output

account_id	final_balance
301	62.00
101	25.00
201	26.00
